

FEEDING RECOMMENDATIONS

EnerGII can be fed at a wide range of feeding rates and to various groups of cows depending upon the dairy's current feeding strategies and performance goals.

High Performer

Feed from .5 to 2 pounds of EnerGII to improve milk and reproductive performance, as well as feed efficiency.

Efficiency Minded

Feed EnerGII at .5 to 1 pound, with higher feeding rates to early lactation cows to manage costs and improve performance through healthy cows.

Getting Started

If you are new to feeding bypass fat, feed .5 pound EnerGII in the fresh and/or high pens to keep outside feed costs to the minimum.
